

Understanding the Federal Compliance **Protocol Builder**

Federal contractors face more requirements, more regulations, and more change than ever before.

Yet much of that compliance is still managed through spreadsheets, PDFs, emails, disconnected forms, and inadequate GRC systems.

The problem is not simply collecting information.

Today, the bigger problem is identifying which requirements actually apply.

The problem is turning lots of information from many sources into something an organization can reliably use.

- A FAR clause can be identified.
- A DFARS requirement can be interpreted.
- A standard can be reviewed.
- A contractual obligation can be documented.

But those requirements do not arrive as a ready-to-execute compliance process.

And the consequences of getting it wrong are becoming more significant.

Lots of regulations

- Buy American Act
- OFAC/SDN
- ITAR
- Incurred Costs Submission

But no one tells you exactly what to do.

For affected defense contractors, federal compliance is no longer simply an internal policy exercise. It is increasingly part of the contracting environment itself.

Enforcement is moving in the same direction.

At the same time, the Department of Justice continues to use the False Claims Act in cases involving government contractors and cybersecurity requirements.

In June 2026, DOJ announced that defense contractor LOGZONE Inc. agreed to pay \$507,144 to resolve False Claims Act allegations involving alleged failure to comply with cybersecurity requirements in Department of the Navy contracts.

DOJ stated that the issues were identified after a Defense Contract Management Agency assessment of the contractor's implementation of NIST SP 800-171 controls.

The message for federal contractors is increasingly clear:

“We think we’re compliant” is not enough.

Organizations need to be able to demonstrate that compliance obligations have actually been understood and met.

And that becomes difficult when requirements are spread across:

- Regulations / Clauses / Standards
- Customer Requirements
- Contract Obligations

Meanwhile, the processes used to manage them remain scattered across forms, spreadsheets, emails, one-off workflows, and ideas that might have been in someone’s head 20 years ago.

Keeping up can become a full-time job.

One wrong assumption can have real consequences far beyond an inconvenient audit.

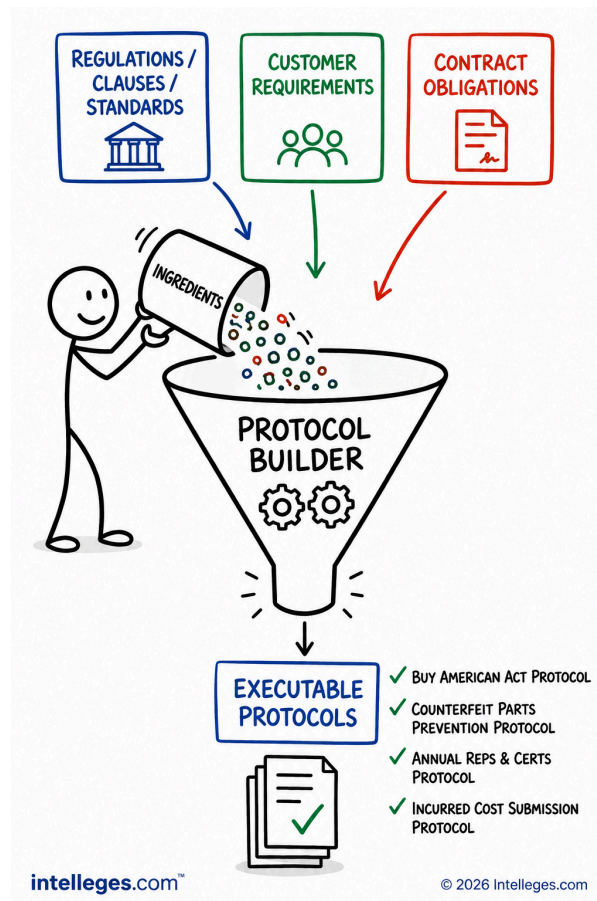

It can affect contracting decisions, customer confidence, remediation costs, and legal or financial exposure.

Federal compliance needs to move from passive tracking to active compliance orchestration.

Federal contractors must continually turn the sources of compliance obligations into something their organizations can actually follow and execute:

For just that purpose, Intelleges created the **Protocol Builder**.

From Compliance Complexity to Active Compliance Orchestration

EXECUTABLE PROTOCOLS

Provide the relevant regulatory, customer, and contractual information, and the **Protocol Builder** turns it into an executable protocol.

Examples include:

- ✓ **Buy American Act Protocol**
- ✓ **Counterfeit Parts Prevention Protocol**
- ✓ **Annual Reps & Certs Protocol**
- ✓ **Incurred Cost Submission Protocol**

The objective is to move away from treating every new compliance obligation as another spreadsheet, another PDF, another form, or another manual project.

Instead, the obligation becomes something the organization can operationalize consistently.

Forms collect information.

Intelleges enables active compliance orchestration.

The business value is straightforward:

- Less dependence on disconnected manual compliance processes.
- Less time repeatedly translating requirements into one-off exercises.
- Greater consistency in how compliance obligations are operationalized.
- Less reliance on institutional knowledge held by a few individuals.
- A scalable way to respond as new regulatory, contractual, and customer requirements continue to change.

And when the organization is asked to demonstrate its compliance posture, it is operating from a defined process rather than trying to reconstruct one after the fact.

Many requirements. One Protocol Builder.

From compliance complexity to active compliance orchestration.
