

Intelleges

LinkedIn post — reference copy (image + caption)

Day 1: You just won the government contract.

Celebration is entirely appropriate.

Day 30: Someone asks a much less exciting question:

"What exactly do we have to comply with now?"

That is where things get complicated.

Winning a government contract can bring with it FAR and DFARS clauses, agency-specific requirements, cybersecurity obligations, representations and certifications, domestic sourcing requirements, flowdowns to suppliers, reporting obligations, and requirements buried inside the contract itself.

And those requirements do not stand still.

For more than 25 years, one of the problems we have worked on at Intelleges is helping aerospace and defense organizations understand, organize, and operationalize compliance requirements.

Historically, much of that work has required teams of lawyers, compliance professionals, procurement people, auditors, and subject-matter experts to read the governing material, determine what applies, translate it into requirements, build questionnaires and evidence requests, and then keep the whole thing current.

That is exactly the problem we are addressing with Intelleges Protocol Builder.

Protocol Builder is designed to help turn governing information — regulations, standards, contracts, purchase orders, flowdowns, and other source material — into structured, operational compliance requirements.

Not just:

"Here is what this document says."

But:

What applies?

What do we have to do?

Who has to do it?

What evidence do we need?

How do we prove we did it?

That distinction matters.

Most compliance software starts after someone has already figured out the requirements.

Intelleges is designed to operate one level earlier: helping determine and structure the requirements themselves, and then using them to drive the downstream compliance process.

That can include areas such as:

Buy American requirements

FOCI

C-TPAT

Annual Representations & Certifications

Incurred Cost Submissions

Sole Source Justifications

supplier and contractual flowdowns

and many other regulatory and contractual obligations

AI makes this substantially more powerful, but AI is not the whole story.

The real value is combining AI with governed requirements, applicability, traceability, evidence, and execution.

So maybe Day 90 does not have to look quite as frightening as Day 30.

Getting the contract is half the story. Keeping it is where Intelleges can help.

If your organization is trying to figure out what applies — and how to operationalize it — I would be interested in comparing notes.
